Footprinting

NOTES FOR CEHv13:

Module # 02:

Footprinting:

SocialMedia:

1. Buzzsumo used for finding accounts.
2. Harvester is used for the finding social media accounts... `harvester -d google.com -l 200 -b duckduckgo`
3. Sherlock too... `sherlock "Mr X"`

Via AI:

`sgpt --chat footprint --shell "use the sherlock to gather personal information about Mr X and save the result to the recon.txt"`

WHOIS Footprinting:

it returns:

1. domain name information
2. contact details of the domain owner
3. Servers
4. Network Range
5. many more...

tools:

1. ARIN
2. RIPE NCC
3. lacnic
4. nslookup
5. whois
6. APNIC for Asia

IP Footprinting:

tools:

1. IP2Location

DNS Footprinting:

Attackers query DNS servers using DNS interrogation tools, such as SecurityTrails, Fiercee, DNSChecker, and zdns, to retrieve the record structure that contain information about the target DNS.

Attacker gathers the DNS info to determine the key host in the network and can perform the social engineering techniques.

Its very important for as it gives info about the location and types of the servers.

USING AI:

sgpt –chat domain –shell “Use DNSRecon to perform DNS enumeration on the target www.flexstudent.nu.edu.pk and save the result to DNSRecon.txt”

above the dns recon is forward lookup.

Now we will see the Reverse Lookup:

its a process in which we give ip and get the corresponding domain info.

Tools:

1. MXToolbox

Network and EMAIL FOOTPRINTING:

Tools:

1. Traceroute which uses ICMP(its internet Title packet as it knocks at every door ie it goes hop-to-hop and tells you about that device ie TTL).... traceroute <domain>

but if the **ICMP is blocked** then use

2. TcpTraceroute..... sudo tcptraceroute <domain>

USING AI:

sgpt –chat footprint –shell “Perform Network tracerouting to discover the routers on the path to a target host www.domain.com”

Now going to EMAIL footprinting:

go to the mail, open an email and then on the right corner click on the 3 dots and then click on show original..... there you can see multiple info:

ie sender address

Collecting Information through Social Engineering on Social Networking Sites

- Attackers use **social engineering tricks** to gather sensitive information from social networking websites
- Attackers create a **fake profile** and then use the false identity to lure employees into revealing their sensitive information
- Attackers collect information about the employees' **interests** and tricks them into revealing more information

What Users Do	What Attacker Gets
Maintain profile	Contact info, location, etc.
Connect to friends, chat	Friends list, friends' info, etc.
Share photos and videos	Identity of family members, interests, etc.
Play games, join groups	Interests
Create events	Activities

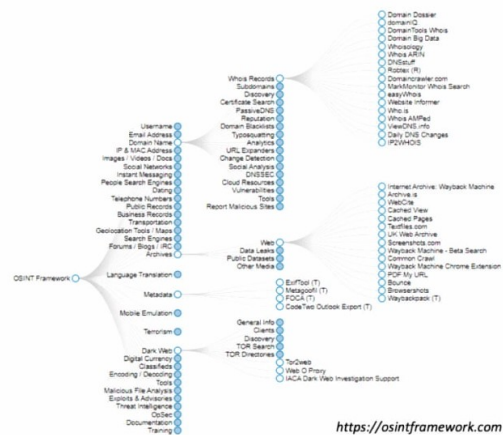

What Organizations Do	What Attacker Gets
User surveys	Business strategies
Promote products	Product profile
User support	Social engineering
Recruitment	Platform/technology
Background check to hire employees	Type of business

Automation Footprinting Usin AI:

1. FOCA is used for meta data of a file
2. subfinder -d <domain> // for the finding all subdomains of a website
3. maltego is used to determine the relationship and real world links between people, organisations, documents and internet infrastructure
4. other tools given below in the picture:

Footprinting Tools: OSINT Framework

- OSINT Framework is an **open source intelligence gathering framework** that is focused on gathering information from free tools or resources
- It provides a simple web interface that lists various OSINT tools arranged by categories and is shown as **OSINT tree structure** on the web interface
- Tools listed includes the following indicators:
 - (T) - Indicates a link to a tool that must be installed and run locally
 - (D) - Google Dork
 - (R) - Requires registration
 - (M) - Indicates a URL that contains the search term and the URL itself must be edited manually

Other Tools:

Sudomy
<https://github.com>

BillCipher
<https://github.com>

whatweb
<https://github.com>

Raccoon
<https://github.com>

Recon-Dog
<https://github.com>

Web Check
<https://web-check.xyz>

OSINT.SH
<https://osint.sh>

Copyright © EC-Council. All Rights Reserved. Reproduction is Strictly Prohibited. For more information, visit www.eccouncil.org

now lets move towards ai footprinting:

1. Tranis AI is and OSINT AI
2. OSS Insight: AI provide in-depth insights into the GitHub ecosystem
3. DorkGPT
4. DorkGenius
5. Google Word Sniper
6. Cylect.io
7. ChatPDF

FOOTPRINTING COUNTERMEASURES:

Footprinting **Countermeasures**

Restrict the employees' access to social networking sites from the organization's network

Configure web servers to avoid information leakage

Educate employees to use pseudonyms on blogs, groups, and forums

Do not reveal critical information in press releases, annual reports, product catalogues, etc.

Limit the amount of information published on a website or the Internet

Use footprinting techniques to discover and remove any sensitive information that is publicly available

Prevent search engines from caching a web page and use anonymous registration services

Last Tip for Hackers:

To Be Safe online when you take part into projects or targeting a victim then you must have a separate identity.... I came to know that today as I keep my real profile with my hacking stuffs and post them and its a big mistake I'm doing but If I keep going like that then it will create a great tragedy for me in My future. KEEP HACKING and Let you work SPEAK!!!!
