Google Dorks:

We can use google smartly by just using some operators.

1. `site: site.com` //it filtered out all the sites related to the specific site.
2. `site: *.site.com` //it will filter out all the sites related to this domain like sub-domains
3. `intitle: admin` //it will dig out all the pages having title admin
4. `filetype: pdf` // it will find out all the pdfs(or xml, xls, etc) related to a site by using site operator side by side.
5. `cache: site.com` //will load all the cache result of the website stored with the google

Feature	<code>inurl:</code>	<code>intitle:</code>
Searches in	URL path	HTML title
Useful for	Finding specific endpoints/files	Finding specific page types
Used in	Endpoint discovery	Directory listing discovery
Targets	Structure	Page content metadata

You can also utilize the “exploit-db.com/google-hacking-database”, it contains all the smexy google dorks useful for hacking and web app footprinting.

`.wp.bak` is the backup file for a wordpress’s website.
